Test Case's for Project

Userstory 1:   "If a user opens the application they will be prompted with a log in screen. which they
               will log in with an email and password."

Testcase 1:   Inputs:

               AppStartButton: pressed

               Email entered: entered

               Password: entered

               LoginButton: pressed

               Expected Output: User is logged in and accesses home page of application

               Actual Output: Depends if email/password combo is linked to a registered account.
                              If not user prompted to construct account.

Userstory 2:   "A user wants to make an appointment to have their yard cut"

Testcase 2:   Inputs:

               Date: Time and day to schedule appointment

               Payment: A payment method to pay for the landscaping

               Address: The location of where the grass needs to be cut

               Expected Output: User is notified of a successful appointment and emailed a receipt

               Actual Output: Depends on if payment method is valid, date is valid, and if time falls
                              during normal work hours.

Userstory 3:   "A user wants to submit a claim regarding a inadequate job/ failure to show on
               scheduled appointment date and time."

Testcase 3:   Inputs:

               Date: Time and day of incident
               Location: Address of appointment

Receipt: provided

Employee: name of employee assigned to appointment

Expected Output: Successful submission of claim

Actual Output: Successful submission depends of valid inputs
Location, Receipt, Employee.
